ABSTRACT

The need for the integration of generic skills training into structured PhD programmes is widely accepted. However, effective integration of such training requires flexible delivery mechanisms which facilitate self-paced and independent learning. A video recording was made of an eminent speaker delivering a 1-h live presentation to a group of 15 first-year science and engineering PhD research students. The topic of the presentation was inter-disciplinary professional communication skills. Following the presentation, the video recording was post-processed into seven alternative podcast formats. These podcast formats included a typed transcription, a full audio recording, a full video recording, presentation slides with embedded speech etc. The choice of podcast formats was based on ease-of-production by a typical computer-literate academic and ease-of-use by a typical computer-literate student. At a subsequent session, the seven podcast formats were shown to the 15 students and a survey to assess their reactions to the various formats was carried out. The survey results (quantitative and qualitative) were analysed to provide useful insight into the student preferences in relation to podcast formats. The students expressed a clear preference for summary key-point slides with explanatory voice-over by the original speaker.

1. Introduction

Recent years have seen a growing recognition and general acceptance of the need for the introduction of structured generic skills training into postgraduate research programmes (often referred to as 4th level education) in Ireland, see for example Forfas (2007), HEA (2006), IUA (2005, 2008), IUQB (2005), NUIM (2007). This recognition and acceptance is consistent with international practice in fourth level education development, see for example, Carnegie (2007), EUA (2007), Manathunga (2008), Rifkin and McLoughlin (2004), Roberts (2002), Spinks, Silburn, and Burchill (2006), UKGRAD (2001, 2004, 2008a, 2008b), UniSA (2008). Despite such a widespread development, effectively embedding and integrating generic skills training into postgraduate research programmes remains a challenge for a number of reasons such as

- Each student's research programme is unique to the student and ideally generic skills training should be available at a time most appropriate to the student's needs, DeViney and Lewis (2006), IUQB (2005).
- Time pressure to complete the research workload can result in little or no time for generic skills training.
- Despite the widely recognised importance of the generic skills training, the primary objective of a PhD research programme is the creation of new knowledge. The generic skills training is seen by some students and faculty as secondary rather than complimentary to their primary research goal.
- Depending on the career aspirations of each individual student, different students will require different generic skills modules and these modules will require some level of customisation, UKGRAD (2004).
- The development of many generic skills are more conducive to experiential learning than formal training courses, e.g. teamwork.

A number of researchers have looked towards the use of online learning resources to help alleviate the problem, for example, by enabling self-paced access to generic skills training resources, NewRoutePhD (2008), SkillCity (2008), Vicent et al. (2006), UKGRAD (2008),

McKinney, Dyck, and Lubner (2009), McLoughlin and Luca (2002), Peat, Taylor, and Franklin (2005), Hong, Lai, and Holton (2003), Bennett (2007), Russell (2007). As is common throughout the literature, we use the term 'podcast' rather loosely to refer to any text/audio/video content which can be made available on the Web or on an intranet such as a university virtual learning environment (VLE). An accurate definition of the term 'podcast' is presented in Deal (2007, p. 2) which explains that a podcast consists of an audio/video file which is posted on a Web server along with an RSS feed. Would-be recipients of the podcast file(s) need to subscribe online via the URL of this RSS feed. Deal (2007, p. 2) notes that 'generating appropriate and compelling content for a podcast is typically the most time- and labor-intensive part of the process'. Posting the podcast file(s) to a Web server and setting up the RSS feed is often automated whereby registered students will automatically receive any material posted to the module space within the VLE. The aim of this work is to help optimise the 'time- and labor-intensive part of the process' and generate podcast content in a format which the target students deem best suits their learning needs.

2. Research question and objective

Reinforcement has been identified as the most effective learning intervention (Coffield et al., 2004b, Table 14 p. 52). However, the most effective means of reinforcing a learning object (Wiley, 2000) is unclear and is likely to remain so until the pedagogical impact of each such means can be estimated. The problem is further compounded by the variety of known learning styles (Coffield et al., 2004a). This is an enormous task which will require a concerted team effort from across the community to undertake effectively. Whatever reinforcement mechanism(s) eventually wins out, its choice should at least take account of general student subjective preferences in relation to a variety of such reinforcement mechanisms. The primary aim of this study is to gain insight into these subjective preferences. A secondary aim is to motivate the community to work together on this enormous task.

In light of the varied and often conflicting findings throughout the literature as to the effectiveness of online learning resources and the many calls for further research in this area, it was decided to focus this research on one specific aspect of a very broad and multifaceted issue and to frame the research question accordingly: do postgraduate research students in the faculty of science and engineering have a preferred podcast content format which they feel best suits their communication skills development needs and if so, what is this preferred content format? It should be made clear that it was beyond the scope of the study to estimate the pedagogical impact of all seven podcast formats. Such an ambitious undertaking would require a significantly increased student cohort size such that the many known learning styles (Coffield et al., 2004a) are sufficiently represented across the cohort and further that the pre-dominant learning style of each individual student within the cohort would need to be measured to facilitate effective pedagogical impact analysis. Although our modest research question was aimed purely at estimating student preference, the research literature suggests that the answer to this question will help to inform future research on the much broader and more complex pedagogical impact question.

3. Background

3.1. Postgraduate researcher generic skills training

The Irish Universities Association (IUA) graduate skills statement, IUA (2008), lists the following seven generic skills categories:

- Research skills and awareness.
- Ethics and social understanding.
- Communication skills.
- Personal effectiveness/development.
- Team-working and leadership.
- Career management.
- Entrepreneurship and innovation.

Within each of the seven categories, specific skills are listed. These skill sets are largely in line with similar overseas graduate skills statements, Carnegie (2007), UKGRAD (2001), UniSA (2008). In relation to the IUA graduate skills statement, one point to note is the fact that there are significant elements of communication skills in all seven categories, e.g. "synthesise new and complex information" under research skills and awareness; "avoidance of plagiarism" under ethics and social understanding; "persuade others of a viewpoint's merits, demonstrating and communicating credible suggestions to achieve one's aims" under personal effectiveness/development, to list but a few. This over-arching nature of communication skills affirms their importance. The relative importance of communication skills over other generic skills is further evidenced in Spinks et al. (2006) who surveyed three cohorts of engineering graduates on the relative importance of a selection of generic skills. For this reason, the focus of this work is primarily on communication skills development. However, the over-arching nature of communication skills as evidenced in the IUA graduate skills statement and related graduate skills statements, suggests that the findings may be readily adaptable to other areas beyond communication skills.

3.2. Podcasting (communication skills development and online resources)

Many university students today have grown up surrounded by multimedia instructional content and are totally comfortable with such learning resources. Mayer (2001) investigated the potential of multimedia content (specifically simultaneous pictures and associated speech) for helping learners. He presented seven principles for the design of multimedia messages, namely, multimedia, spatial contiguity, temporal contiguity, coherence, modality, redundancy and individual differences, Mayer (2001, p. 183).

Recently, Middleton (2009) has presented the findings of a university-wide pilot study to encourage academics to creatively explore learner-centred applications for digital audio. The study was 'initiated to promote learner-centred approaches to a blended curriculum'

(p. 143). He found that the use of digital audio podcasts provided 'a mechanism to move towards learner-centred pedagogies' (p. 153). However, he also found that academics could be held back by issues such as 'lack of technical learning strategy and lack of confidence'.

Lim, Hsiung, and Hales (2006) shows that in the medical field, the use of online resources to support the development and updating of a range of competencies including communication skills is now widely established. For example, since 1994, practicing psychiatrists in the US are required by the American Board of Psychiatry and Neurology (ABPN) to renew their certification every 10 years. The ABPN recertification requires that a range of 'competencies' be kept up-to-date including 'interpersonal and communication skills'. The ABPN recommends a range of online resources including so-called 'netcasts' (often referred to as 'webinars') which can be 'accessed at ones own pace' 'by self-directed learning'. Such use of online resources to support the development/updating of core competencies is not limited to the ABPN but rather is now commonplace across the medical profession for what they refer to as maintenance of certification (MOC) as required by the American Board of Medical Specialties (ABMS), (<http://www.ams.org>). Other professions such as science and engineering which now recognise the importance of communication skills development stand to gain by adapting related training resources and practices from the medical profession. Lim notes (p. 541) that in recent years, the CME landscape has changed radically from one in which 'credits had to be earned by subscribing to journals, completing questionnaires, paying fees for CME, ... traveling to meetings which would incur associated cost such as airfare, accommodation, and registration' to a far more convenient landscape nowadays in which 'anyone with a computer and an internet connection can download articles, ... and read or watch CME content right on the computer, which saves time and money'.

In the higher education sector in general there is also a growing recognition of the need for generic skills development. For example, McLoughlin and Luca (2002), p. 572 present an interactive approach to developing team skills through the use of 'online-learning and self-directed learning pedagogies'. These team skills include communication skills. They note that many university course curricula result in the students developing 'inert knowledge rather than transferable skills attuned to the complexities of professional life' whereas, 'many employers expect not only a strong knowledge base, but also diversified social, communication and cooperation skills' in university graduates (p. 572). They cite 'economic realities' as being largely responsible for necessitating 'new delivery strategies and approaches to developing lifelong learners'.

Other related attempts to develop online resources to support communication skills development in the face of 'economic realities' are evident in the higher education literature, for example, Peat et al. (2005, p. 142) developed a set of 'comprehensive online resources' to facilitate independent learning and the enhancement of her student's 'oral and written communication skills'. Peat's online discussion forum analysis 'showed that participating students practiced their thinking and communication skills particularly at the more sophisticated levels as postulated by Bloom (1956).

McKinney et al. (2009) presents a study into the effectiveness of podcasts as an alternative to face-to-face lectures. They note that many related studies 'have shown that class attendance is far superior to getting lecture notes from a friend or even from the professor' (p. 618). A key difference between McKinney's study and many related studies is that in most related studies the effectiveness of the podcasts is examined as a follow-up enhancement to the face-to-face lecture, i.e. the students using the podcasts had also attended the associated face-to-face lectures. The McKinney study is different in that it sets out to examine the effectiveness of a podcast *as an alternative* to attending the original face-to-face lecture. The results showed that the student group who only had the podcast to work with (i.e. they did not attend the original face-to-face lecture) scored significantly higher in the exam than the student group who attended the face-to-face lecture (and were not given access to the podcast!). Their analysis identifies two key factors associated with the higher performance of the 'podcast' group, namely,

1. The high-scoring podcast students compiled detailed notes on a paper copy of the associated PowerPoint slides while watching the podcast and
2. they studied the podcast more than once, on average 2.56 times.

Similarly, Lazzari (2009) reported a positive impact of the use of podcasting on the learning experience of a group of undergraduate university students studying multimedia communication and human-computer interaction. Lazzari found that the positive impact was not evidenced in their exam results but rather in 'satisfaction surveys and interviews'. It should be pointed out that Lazzari had the students involved in actually producing the podcasts as well as receiving them.

There are also negative findings throughout the literature as to the effectiveness of online resources in the support of communication skills development, for example, Vicent et al. (2006) present the findings of a study as to the appropriateness of e-learning resources for the development of 'transversal skills'. What they refer to as transversal skills include 'interpersonal, teamwork, learning and communication skills'. One of the specific competences which they list under interpersonal skills is the 'ability to integrate and communicate with experts from other areas and in other contexts' (p. 2). The online resources used include synthetic or computer-generated video, video lessons (recorded specifically for viewing on a computer), video recording of an on-campus class, video movies, video recording of interviews etc. Vincent's methodology consisted of an email survey of 45 university lecturers (35 engineering and 10 humanities). The lecturers were asked to rate on a scale of 0–3 the appropriateness of each resource for the development of each skill. An internet link is given from which the detailed results can be downloaded (albeit in Spanish!). According to Vincent's survey results the various online video resources were deemed NOT well suited to developing the 'ability to integrate and communicate with experts from other areas and in other contexts'. However, the conclusion does note that 'lecturers prefer to work skills like written communication ... in the LMS's than in the classroom' (p. 6). It should be borne in mind that these results are based on the opinions of the 45 university lecturers surveyed (35 engineering and 10 humanities). It is unclear as to what level of experience these survey respondents actually had at teaching 'transversal skills' such as 'ability to integrate and communicate with experts from other areas and in other contexts'. Indeed, many engineering education commentators have noted that engineering curricula in general are so heavy on technical content that transferable skills become totally neglected, e.g. Sheppard, Macatangay, Colby, and Sullivan (2009). Although it was noted that 35 of the 45 lecturers had 'experience of e-learning', it must be assumed that this experience is largely within their own discipline, i.e. engineering (35) or the humanities (10). Despite Vincent's findings, he nonetheless concludes that 'pedagogical methodology, or how e-learning tools must be used to develop and evaluate competences, should be studied in depth' (p. 6). This conclusion is supportive of our current research.

Mixed findings in the literature are further evidenced in [Hong et al. \(2003\)](#), who present a study of postgraduate student's level of satisfaction and perceived learning with a web-based course. They include a broad review of previous research on web-based learning in general and highlight contention in the community as to the impact of web-based delivery on learning. Although their research shows that 'achievement in the web-based course was comparable to a face-to-face version of the course' (p. 123), they note that some online groups 'had better group dynamics than others'. Although they do not give a percentage, they do note that some students were 'lurking, listless, lagging and lost'. Such findings support the case for blended delivery as opposed to 100% web-based. They conclude that further research is needed to refine the web-based environment to support and enhance student's learning.

[Bennett \(2007\)](#) also studied the effectiveness of online resources (specifically videoed lectures) as teaching tools in general. He acknowledges that video content can effectively supplement a learning experience, for example, by grabbing a student's attention and motivating them to learn or by giving a highly realistic depiction of reality. He warns strongly against the use of video recordings of live face-to-face lectures but at the same time he acknowledges the fact that such recordings can be useful in allowing a student to catch up if they miss the face-to-face lecture thereby enabling a 'more flexible learning pattern'. His broad review of the literature shows 'conflicting findings' with some evaluations indicating that videoed lectures can improve student's grades and increase their overall level of satisfaction while other evaluations found that the availability of videoed lectures made no significant difference. He suggests two ways in which videoed lectures might potentially have a negative impact on student learning, namely, videoed lectures make learning uninteresting and secondly, they may hinder the development of students as independent learners.

4. Research design

The methodology which we devised in order to capture the necessary data involved firstly video recording a 1-h workshop presentation. The topic of the workshop was postgraduate communication skills and the speaker was a vastly experienced and highly regarded expert in the field. The student cohort consisted of 15 first-year science and engineering PhD research students. The video recording process was deliberately non-invasive in that no specialised lighting was used. A small Sony Handycam (DCR-HC24E) was mounted on a tripod and positioned discretely at the back of the room. It was set recording at the start of the presentation and left unmanned throughout. Ethical approval for the research was obtained in writing in advance from the University Ethics Committee. Informed consent was also obtained in writing from all of the participants prior to the session. Following the session, the video recording was post-processed into seven alternative podcast formats. A mixed-methods approach was deemed most appropriate to produce the required representative variety of podcast content formats. The podcast formats were selected with the following prioritized criteria in mind,

- That the selection of podcast formats be straightforward to use by any computer-literate student.
- That the selection of podcast formats be straightforward to produce by any computer-literate academic without the need for specialist training.
- That the selection of podcast formats while not being exhaustive, was nonetheless sufficiently varied as to be representative of most likely podcast formats.
- That the podcasts be low-cost to produce, i.e. that the resources needed to produce the various formats be either freely available or available at low-cost for all popular computer platforms.

The seven podcast formats were as follows:

1. *Full video*: The post-process in this case simply involved saving the video file in a popular format which facilitated video streaming via a standard broadband internet connection. Numerous freeware and low-cost computer applications are available for performing this process.
2. *Full audio*: The post-process in this case simply involved saving the audio content from the recorded video. It was saved as an MP3 file. Again, numerous freeware and low-cost computer applications are available for performing this process.

Fig. 1. Re-enacted video.

3. *Re-enacted video*: In this case, a member of academic staff who had attended the original session recorded themselves re-enacting the key points of the session using a standard white board and the same video camera as was used in 1 above. See Fig. 1.
4. *Re-enacted screencast*: In this case, the member of academic staff who had attended the original session recorded a screencast summary of the key points from the session. Microsoft PowerPoint with the Camtasia screen-capture plugin was used for this process. This is a low-cost and user-friendly solution which any lecturer could quickly master. Technical details of all of the podcast generation software and hardware used in this study are available on request from the corresponding author. Fig. 2 shows a screenshot of this format.
5. *Slides with original embedded audio*: In this case, the original presentation slides had the original speech segmented and embedded as a separate audio file in each slide. This involved using the original video file to identify the individual sections associated with each slide and then saving each audio segment as a separate file. These audio files (in .wav format) were then embedded in their associated original slides using Microsoft PowerPoint to create the desired podcast format. Fig. 3 shows a screenshot of this format.
6. *Raw slides*: In this case, the original set of unedited presentation slides were simply made available online. We used Microsoft PowerPoint for this format.
7. *Raw transcript*: In this case, the full audio recording from the presentation was typed-up 'word-for-word' and made available online in PDF format. Table 1 shows a comparative summary of the main features of the seven podcast formats.

4.1. Quantitative data capture

All 15 of the students who attended the original session were asked to rate the usefulness (in their opinion) of each of the seven podcast formats. This quantitative rating was on a 5-point scale from 'not at all useful' to 'very useful'. The students were also asked to indicate their 'top-3' preferred formats, i.e. their 1st most preferred, their 2nd most preferred and their 3rd most preferred.

4.2. Qualitative data capture

The students were also asked to provide written comments to qualify their preferences.

5. Results

5.1. Quantitative results

The quantitative results are presented in Table 2.

The main points worth noting from the quantitative results in Table 1 are:

- Podcast format 5 (slides with original embedded audio) was deemed the most useful with 13 of the 15 students ranking it among their top three preferred formats.
- Podcast format 3 (re-enacted video) was deemed the least popular with only one student ranking it among their top three preferred formats.
- Podcast format 2 (full audio) was deemed the second most useful with 10 of the 15 students ranking it among their top three preferred formats.
- Podcast format 1 (full video) was a close third in the top-3 preference ranking.

5.2. Qualitative results

As indicated above, qualitative data was also gathered in the form of written comments on what the students liked and/or disliked about each podcast format. This data was analysed using an interpretivist approach, Miles and Huberman (1994). The main points worth noting from this qualitative data analysis are:

- The principal reason cited for the popularity of format 5 (slides with original embedded audio) were:

7. Raw transcript	4	3	4	3	1	3	1	1	5

- Its multimedia nature. Eight of the students who ranked this format in their top-3 cited this multimedia nature as a reason. Example comments included: *'Useful because you can follow in an independent way the speech while made focusing on key words on the screen'*; *'Much better as you can listen to Dr. Downey and look at slides at the same time'*; *'Very useful to see written points at same time as listening, key points being emphasised'*.
- Its use of original speech as opposed to a third-party interpretation. Three students cited this as important. Example comments included: *'Prefer this as you have original speaker'*.
- Two students liked the fact that the file size for this format was relatively small. Example comments included: *'With original audio and written notes, it includes all the content, and not such a large document'*.
- The principal reason cited for the unpopularity of format 3 (re-enacted video) was that it was a third-party 'interpretation' of the presentation and not the original speaker. Twelve of the 15 students wrote comments to this effect. Example comments included: *'Too much dilution from the original content'*; *'Only thing that I can say about this is that we might not pick out the same key points so potential to lose some info'*; *'Regardless of who compresses the information I would feel like something was missed'*.
- Podcast format 2 (full audio)
 - The convenience of this format was cited by five students. Example comments included: *'Very useful for this particular talk, all info given on day of workshop readily available for future ref. MP3 file very easily transported and stored'*; *'I feel the audio alone would be easier to access. I might listen to it again and take some notes out for myself on the points I thought were important. Its useful because taking notes during the presentation might make you miss something'*.
 - However, two students commented that it would be too long to listen to the whole file. Example comments included: *'It would just be too boring trying to listen to an audio file for an hour'*.
- Podcast format 1 (full video).
 - Five students commented on the poor quality of the video recording. Example comments included: *'I like that it's the complete talk but for myself the quality might get irritating, video is needless. Also the size and length of the file would discourage me'*.
 - Five students commented that it would be too long to watch the whole video. Example comments included: *'Good resource but quality of video makes it tiring to watch for long periods of time. Length of video would put me off before I even started. Very useful if you missed a session or were not eligible to attend. Very necessary for speaker to be good speaker or would get bored quickly. With this resource (and No. 2) I would be shy to get involved during the actual presentation because I know its being recorded. Should keep this in mind if you want people to get involved in the session rather than just listen'*.
 - The inconvenience of the very large file size was also commented on by three of the students.

The qualitative analysis highlighted some interesting issues. For example, one student notes in their comments that knowing that a presentation was being recorded would make them less likely to ask questions (see final quote above). Although only one of the 15 students made a comment to this effect (we had not specifically questioned them on this issue) we decided that it was worthwhile following up.

5.3. Focussed follow-up

The qualitative data analysis raised six focused follow-up questions. These focused follow-up questions were formulated into a follow-up interview sheet (see Appendix 1). Five of the original 15 students were then interviewed individually to capture their answers to and comments relating to this set of questions. The main findings of this focused follow-up were as follows:

- If students know that a session is being recorded, then they are less likely to ask questions and actively engage in the session.
- Students do like to have a paper copy of the presentation slides for making notes on during the session.

6. Discussion

Much research has been carried out in an effort to assess the effectiveness of online learning resources. Some researchers report positive effects, some negative and some report little or no effect. Many researchers acknowledge the conflicting findings throughout the literature and in turn call for further research. Few researchers make reference to Mayes important principle that '*there are really no models of e-learning per se – only e-enhancements of models of learning*', Mayes and de Freitas (2004, p. 4). So the effectiveness of an online learning resource depends heavily on the underlying model of learning. If the resource is systematically integrated into the underlying instructional design and clearly aligned with the learning outcomes and assessment methodology, then the resource has the potential to be far more effective than if it is simply uploaded and monitored as an optional extra. Mayes principle suggests that the most effective approach to e-enhancing a model of learning is to start with a tried, tested and pedagogically proven model and to iteratively explore small prospective e-enhancements, incorporating and possibly adapting what works and discarding what does not. The single most influential stakeholder in an underlying pedagogically proven model is the lecturer who is also the subject matter expert. Only they are in a position to explore such e-enhancements and adaptively incorporate or discard as appropriate. In light of the growing range of possible e-enhancing resources available, a busy lecturer could be forgiven for feeling over-whelmed. The other major stakeholding group in the underlying model of learning are the students themselves. For this reason we set out to investigate student preferences in relation to a selection of low-cost conveniently produced podcast formats.

The research was further focused on professional communication skills as the generic skills literature suggests that this is the most important of the recommended postgraduate generic skills. The results of the survey analysis gave good insight into target user preferences in relation to podcast formats. Despite the narrow focus of our research, i.e. science and engineering postgraduate researcher professional communication skills, the nature of the findings look readily scalable to other skills and disciplines. For example, the use of a multimedia podcast format with original speaker embedded speech was popular. Such qualitative preferences are largely independent of the subject matter content and as such may be readily scalable.

An accepted weakness of the present study was the small number of subjects, i.e. 15. Whilst studies of this kind are useful in helping practitioners vicariously gain insights into their own practice, the findings of this study should be taken as tentative. Knowledge about the ways in which students prefer to have content delivered should help us in our practice and stimulate both discussion and debate about the purpose of asking students to participate in this form of learning. The fact that the study was small scale enabled the performance of an in-depth analysis of the data, yet the small number of participants limits applicability of the findings. Although generalisability was not an intention of this study and no groups are the same, for future research, the intention is to replicate the survey study with future cohorts of science and engineering postgraduate students to see if the conclusions are sustained. This additional research across other groups could be used to determine how widespread the interpretations are. For this reason we intend to repeat the survey study with future cohorts of our science and engineering postgraduate students to see if the findings remain consistent. We also invite all interested academics from any discipline to repeat the study with their own students and email us the resulting survey data which we will collate and make available back to the community along with appropriate inferential statistical analysis. It is felt that only through such a team effort across the community is it likely to move towards resolving the widespread conflict as to the learning impact of podcasting instructional content.

One interesting finding which was only uncovered via the focused follow-up questionnaire is the fact that the majority of students are less likely to ask questions and actively engage during a face-to-face session if they know that it is being recorded. Further, if the video recording needs to be of better quality, as indicated by 5 of the 15 students, then this would probably warrant specialised lighting and a camera operator making the recording process more invasive and in turn making students even less likely to ask questions and actively engage. It would be worthwhile verifying this finding with larger cohorts in a range of disciplines. If it holds true, then the most effective podcast format may well be a set of slides with embedded speech which the lecturer records privately and makes available to the students allowing sufficient time to study and read around prior to a face-to-face questions and answers session on the topic. Any related reading material might also be made readily available to the students in advance to facilitate their informed engagement in the discussion session. Such discussion can be hosted and/or continued online via a discussion forum if necessary. The advantage of the online asynchronous discussion is that it allows time to reflect and research between postings but as many practitioners have indicated in the literature, it does not guarantee any of these three activities.

Communication skills are often associated with team-work. Peat et al. (2005) notes that 'teamwork is considered to be one of the most important skills of a practicing scientist'. She notes further that much of the team-work for her students is developed 'in a face-to-face environment, rather than online' (p. 142). A group task which she finds 'is an excellent way to introduce students to the concept of dissemination of scientific endeavor' is a poster presentation. It is concluded from Peat's findings that a useful 'permanent' online archive of good (and maybe also not-so-good!) scientific poster presentations would be a worthwhile resource to support the student groups as they engage with such tasks. A further conclusion is that online moderated discussion about the pros and cons of such resources may well push the students 'thinking and communication skills particularly' to the 'more sophisticated learning levels as postulated by Bloom' (p. 142).

As mentioned above, [Bennett \(2007\)](#) suggests two potentially negative impacts of videoed lectures, i.e. making learning uninteresting and hindering independent learning. These are indeed valid points, for example, if a student had to access an entire course via videoed lectures, that could potentially make for an uninteresting learning experience. However, no reference is made to the more fundamental pedagogy underlying the course in which the videoed lectures are used. Recall that the making available of videoed lectures should be nothing more than an e-enhancement of an instructionally designed course delivery (or pedagogy), [Mayes and de Freitas \(2004\)](#). Perhaps the reason for the ‘conflicting findings’ regarding the suggested benefits may simply be down to the fact that some of the underlying pedagogical practices were more successful in integrating the videoed lectures and aligning them with the learning outcomes and the associated assessment methodologies. For example, during the course of a live face-to-face lecture, the lecturer might pose a question and ask the students to reflect on and research this question after class and further to document and post their reflections on a discussion forum associated with the lecture and/or to reply to at least one other reflective posting. There is growing evidence that such reflective interaction facilitates deep learning, [Donnelly and Gardner \(in press\)](#), [Lawlor \(2008a,b\)](#), [McLoughlin and Luca \(2002\)](#). However, facilitating such reflective and interactive learning in this way still does not guarantee that the intended learning actually happens for all students. The level and extent to which deep learning is likely to follow depends on many factors, some of which are under the control of the lecturer and some of which are not. Factors which the lecturer has some control over include:

- The way in which they frame and communicate the question.
- Their training and experience at moderating an online discussion forum.

In learning intervention parlance, these factors would come under so-called ‘instructional quality’ which research shows to be the second most effective learning intervention among post-16 year olds, [Coffield et al. \(2004b\)](#). However, according to the extensive critical review of learning styles and interventions presented by [Coffield et al. \(2004a and 2004b\)](#), the most effective learning intervention is in fact ‘reinforcement’ (see Table 14 p. 52 of [Coffield et al. \(2004b\)](#)). Of course reinforcement can happen in many ways but one cost-effective way to at least facilitate it is to have some version of the instructional content available online 24/7. Further, if the format of the content is somewhat aligned with general student preferences then this will hopefully add to the desired effect.

The main factors outside of the lecturers control are:

- the student’s prior cognitive ability; and
- the student’s disposition to learn.

Interestingly and perhaps fortunately, these factors rank slightly lower on the learning intervention effectiveness scale. Whilst it is recognised that conflict in the research literature exists on the effectiveness of videoed lectures (and online learning resources in general) as a teaching tool, it is argued here that if carefully designed and integrated into good pedagogical practice, they have the potential to e-enhance the learning experience and to facilitate flexibility in course delivery.

[McKinney’s \(2009\)](#) key findings relating to high-scoring students making their own hand-written notes on a paper copy of the podcast content slides and viewing the podcasts more than twice do sit comfortably with related pedagogical research findings, e.g. by compiling their own notes while watching the podcast, the students are reflecting on and internalising the content in an interactive manner, [Coffield et al. \(2004\)](#). Secondly, the podcast group viewed the podcast multiple times which implies reinforcement which as mentioned above has independently been shown to be the most effective learning intervention, [Coffield et al. \(2004\)](#).

7. Conclusion

The primary objective of this study was to gain insight into student subjective preferences across a representative selection of alternative podcast formats. The results indicated a reasonably clear preference for a format which featured the original speaker’s voice segmented and embedded into the associated slides. While this is an interesting and hopefully useful result, it would be worthwhile substantiating it with more students and across other disciplines. This is part of our ongoing and future work and we also invite the community to work with us in this endeavor.

It is reasonably well established among the community that a well designed podcast does have the potential to e-enhance a learning experience. However, the realisation of that potential does not follow automatically. It is also well established that the podcast (or any learning object) must be carefully integrated into the course in question rather than bolted on as an optional extra if the potential e-enhancement is to be realised. The person best placed to effectively integrate the podcast into a course is the one teaching the course as the integration needs to be aligned with their individual teaching style. It is hoped that the findings presented herein in relation to student podcast format preferences will help guide academics in their choice of a podcast format. The effective integration of the chosen podcast into a course is largely down to the academic alone although [Middleton \(2009\)](#) has recently presented some useful guidelines on this matter. The abundance of conflicting findings as to the effectiveness of podcasts suggests that the debate looks set to continue well into the future. It is suspected that the effective integration or not could be a factor behind the conflicting findings.

Acknowledgments

The help and support of Emeritus Professor Liam Downey, D.Sc. is gratefully acknowledged. His vast experience as a professional communicator is a great source of inspiration. What he can do with a live audience will never be replicated online, but that does not mean that it cannot be reinforced online!

Many thanks are also due to Dr. Charles Juwah of the Centre for the Enhancement of Learning & Teaching at the Robert Gordon University in Aberdeen for detailed constructive and encouraging feedback on an early draft of this paper.

Thanks also to Dr. Katarina Domijan of our Maths Dept for advice on when not to perform statistical analysis.

Appendix 1

Focused follow-up survey questions

1. If you know that a lecture / presentation / workshop is being video recorded, are you

- (a) less likely to ask questions and actively engage
- (b) equally likely to ask questions and actively engage
- (c) more likely to ask questions and actively engage

Any comments:

2. Do you find it helpful to have a paper copy of the lecture / presentation slides during the session? Please tick a box.

Not at all				Very useful
------------	--	--	--	-------------

useful				

Any comments:

3. In a video recording of a lecture / presentation, would you find slide-based indexing useful? Please tick a box.

Not at all useful				Very useful

Any comments:

4. In a video recording of a lecture / presentation, would you find vari-speed playback¹ useful? Please tick a box.

Not at all useful				Very useful

Any comments:

5. In an audio recording of a lecture / presentation, would you find slide-based indexing useful? Please tick a box.

Not at all useful				Very useful

Any comments:

6. In an audio recording of a lecture / presentation, would you find vari-speed playback useful? Please tick a box.

Not at all useful				Very useful

¹ Vari-speed playback enables the recorded playback to be speeded up or slowed down without affecting the pitch/intelligibility of the original speech. Typical variability ranges from around one third to four times normal speed.

Any comments:
