ABSTRACT

At Indiana University—Purdue University Fort Wayne we have developed ETCS 101—Introduction to Engineering, Technology, and Computer Science, a freshman success course for students in the School of Engineering, Technology, and Computer Science. The main objective of this course is to increase retention. The course aims to provide students with sufficient computer and personal development skills and to help them develop the right mental attitude conducive for academic success. Features of the course include projects of software and hardware nature, extensive use of the Internet and Web software tools, and a team-teaching format. As the main project of this course, small teams of students design, build, program, and test an autonomous mobile robot using LEGO® parts, sensors, and the Robotic Command eXplorer (RCX) controller. This is a multidisciplinary, project-driven learning process that encourages students to develop problem solving and teamwork skills and fosters their creativity and logic.

I. INTRODUCTION

Indiana University—Purdue University Fort Wayne (IPFW) is located in the second largest city in Indiana and it is the sixth largest public university in the state. Total enrollment is approximately 10,000 students. IPFW is a commuter university (there is no on-campus student housing) and more than half of the students attend classes on a part-time basis. The average student age is twenty-seven years. The School of Engineering, Technology, and Computer Science (ETCS) enrolls approximately 1,400 students and is comprised of five departments: Civil & Architectural Engineering Technology, Computer Science, Electrical & Computer Engineering Technology, Engineering, and Manufacturing Technology. Certificate, associate, bachelor, and master degree programs are offered and awarded by Purdue University.

ETCS students are a mix of traditional and non-traditional age students. Many of the students who apply for the first time to any of the departments of the School of ETCS are adults who have been

out of school for several years. These non-traditional students usually hold part-time or full-time jobs in local industry and are highly motivated in earning a degree in a technical field, but their knowledge about the disciplines of engineering, technology, and computer science is limited. This lack of knowledge about engineering is also common in the traditional freshmen engineering students [13]. Other challenges present in this student body are:

- a lack of the proper mindset and attitude for academic success;
- very limited computer skills;
- few opportunities to interact with each other;
- no experience in bringing an engineering design concept to a working prototype; and
- poor written and oral communication skills.

To address these we have developed and implemented a high-tech freshman success course, ETCS 101—Introduction to Engineering, Technology, and Computer Science, that helps students acquire sufficient computer and personal development skills for a successful college career. Computer skills and the right attitude towards obtaining a technical degree have been strongly correlated with retention [4, 6]. The course also provides students with an introduction to several technical disciplines and career information. Individual and team course projects are of software and hardware nature. The course makes extensive use of Web software tools, and it has a team-teaching format. Similar motivating features have been used in freshman engineering courses developed elsewhere [12, 14].

Numerous studies [2, 10] have found a positive correlation between the return rates of sophomores and participation in a freshmen success courses. This is particularly true in a technical degree program [11]. Cheshier [5] reports that less than 50 percent of students entering engineering and engineering technology programs earn their degree in that field.

Our retention rates [9] are lower than those described in these studies. Table 1 shows that after a two-year period, forty percent of ETCS students have left IPFW without obtaining any degree. We believe that this trend is due to the nature of our student population and our university. The main goal ETCS 101 is to decrease this trend and increase retention rates.

II. THE STUDENTS

To gain an insight in the background of the students and to validate the premises under which the course is being developed, a survey is conducted at the start of the semester. Students are asked about their:

- choice of major,
- mathematical background,

- computer expertise,
- number of hours per week dedicated to work,
- number of hours per week dedicated to study,
- number of credits being taken,
- oral and written communication skills,
- ability to work with others, and
- knowledge of professional ethical standards and world affairs.

The results of this survey as well as the course evaluations conducted at the end of the semester are used to assess and update the course content. Since a major claim of the course is its high-tech nature, it is important to continuously revise the nature and content of the projects to address the perceived shortcomings in the backgrounds of the students. Figure 1 shows the computer skills of the students surveyed at the start of the fall 2001 semester (111 students filled the on-line survey).

It is apparent from Figure 1 that the areas where the students have the least background are in programming languages and in Web page development. This finding supports the choice of the development of a Web site and the programming of a robot as a way to increase the students' computer and communication skills. Figure 2 (a) summarizes the answers to the question of the frequency of collaborative work with others and Figure 2 (b) illustrates the amount of time that students spend on campus. The course main project is a team project that requires students to do collaborative work.

These survey results have been consistent for the last two years and give strong support for the need of a course such as ETCS 101. Our students need to increase their computer and programming skills in a positive environment, and they have to be given the chance and means to interact more with each other.

III. THE AUTONOMOUS MOBILE ROBOT

The main project in ETCS 101 is the mobile robot. Small teams of students design, build, program, and test a mobile Robot using LEGO parts, sensors, and the RCX controller. This is a multidisciplinary, project-driven learning process. Robotic projects are multidisciplinary in the sense that they involve a wide range of disciplines, including computer science, physics, mathematics, biology, psychology, engineering, and art. This project helps students to develop problem solving and teamwork skills and fosters their creativity and logic. By working on this project students are introduced to:

- the concept of product development through making iterative improvements;
- working with systems;
- working in teams;
- modularity and abstraction;
- feedback and control;

	Number	Percentage
First enrolled in Spring 1996	203	
Retained in ETCS	105	51.72
Remained in the same ETCS Department	33	16.27

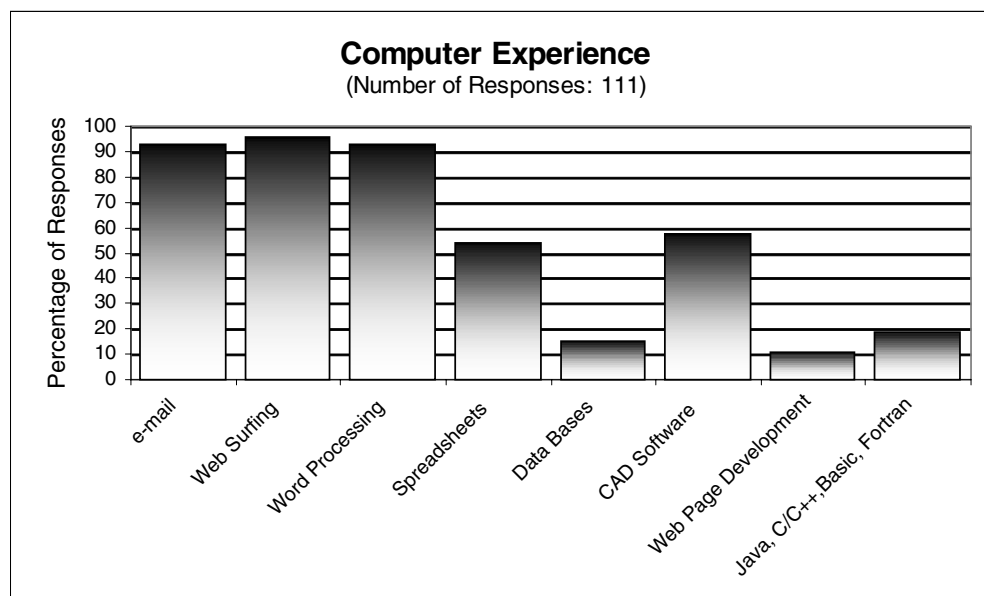

Figure 1. Fall 2001 survey results.

- attention to aesthetics; and
- the value of simplicity and robustness.

All students are involved in building and programming the robot. In addition, each student is assigned a specific role on the team. These roles, shown in Table 2, are decided at the beginning of the project through meetings and discussions among the team members. In forming the teams an effort is made to combine experienced and novice students into a single team of three or four members. The quality of their personal Web site (first course project) is used to gauge the students' computer expertise. The robot project has similar objectives to the one described by Avanzato [1] but the scope here is on a smaller and simpler experience. Also the inclusion of this exciting technology creates a motivational atmosphere at the gateway of the curricula [7].

Building sets from the LEGO Challenger System are used for this project. This project allows each team to develop their own design within a range of specifications. These specifications include a maximum number of components, such as light sensors, gear motors, and resource bricks and one RCX controller (Figure 3). In the first phase of the project, the teams design and build their robots. In the second phase, the teams program the robots to perform the required tasks. ROBOLAB, an icon-based software tool, is used to

write the programs that are then downloaded to the robot controller via an infrared link. The third phase of this project is a demonstration of each team's robot. On the demonstration day, the teams show how their robots perform their assignments in the Engineering and Technology Building's main lobby. In this way, not only students taking the course, but also other students, faculty, and staff have the opportunity to appreciate the projects. Teams are also required to write a project journal and a final report (on a Web page) that describes the planning, design, building, programming, testing, and demonstration of the robot. They are asked to include pictures and diagrams of their robots and programs.

IV. ASSESSMENT OF COURSE OBJECTIVES

Whereas the scope and depth of robotics in ETCS 101 is less than a formal one-semester robotics course, its inclusion in this freshman success course aimed at engineering and technology students has been very positive. Student assessments at the end of the semester consistently report that what they have enjoyed most in the course is the mobile robot project and through it, how to work as a team. Almost seventy percent of the responses to the

Team Member	Role
Manager	<ul style="list-style-type: none"> • Oversees the team's activities • When issues arise, negotiates a consensus among the team members on how to proceed • Ensures that the project is moving forward on schedule
Material Specialist	<ul style="list-style-type: none"> • Tracks the use of the hardware, software, building elements and other materials • Distributes materials • Keeps an inventory and makes sure everyone stores the materials properly
Webmaster	<ul style="list-style-type: none"> • Designs and builds the team's web site • Records the week's work in the on-line team journal
Information Specialist	<ul style="list-style-type: none"> • Collects and summarizes the information for the project, making sure that this information (papers, books, web pages, etc.) is in order and the team members know where they can find it

Table 2. Member roles.

open-ended question, “What did you like most about this course?” are: “The Robot Project.”

These results are similar to the ones reported by Goff [8], where the importance of a hands-on laboratory with interesting, challenging

and fun activities has been highlighted as a way to introduce students to a technical field in a freshman course. The experience of bringing a design from concept to working prototype is valuable preparation for subsequent education and employment [3, 15].

ETCS 101 was first offered as a pilot course in the fall 1999 and in the spring 2000 semesters. A Lilly Foundation grant allowed for the full financing of the course expenses during the 2000–2001 academic year. In the fall of 1999, only students from the Department of Engineering took the pilot course. The course was offered as one of two sections of ENGR 100-Introduction to Engineering. The other section of ENGR 100 followed the old format of that course which primarily consists of a series of seminars about the engineering profession. Tables 3 and 4 below illustrate the current status of students enrolled in the two sections.

Tables 3 and 4 provide evidence that the new course, ETCS 101, has a very positive impact on retention in the School of ETCS. In this comparison both the control and the test groups were made up only of students enrolled in the engineering program. These results also compare very favorably with the ones shown in Table 1 that shows the retention rates, over a two year period, for all ETCS students during a time when only the engineering students used to take ENGR 100 (old format).

Tables 5 and 6 show the current status of students enrolled in ETCS 101 during the fall 2000 and spring 2001 semesters. During

Table 6. Fall 2001 status of engineering and technology students enrolled in spring 2001.

that academic year, students from the Department of Engineering as well as from two technology departments, Civil and Architecture Engineering Technology (CAET) and Manufacturing Technology (MFT) enrolled in ETCS 101. The total enrollment also included a handful of students from the Computer Science (CS) and from the Electrical and Computer Engineering Technology (ECET) departments. ETCS 101 is now a required course in the curriculum of the engineering, CAET, and MFT programs while students in the CS and ECET departments take it as an elective.

The results shown in Tables 4 and 5 cover only a one-year period and thus are preliminary, but they point to a very positive retention outcome. We plan to follow up the status of the students in the next years to better assess the impact on retention.

V. CONCLUSION

The importance of a successful introductory course to the engineering, technology, and computer science disciplines has been highlighted. The main objective of this course is to increase retention. The course provides students with an introduction to several technical disciplines, timely academic counseling, and career information. A very important component of the course are the projects that are student-centered and of a multidisciplinary, high-tech nature. As a result of these projects the students achieve a basic competence in the use of computers and working in a team. More information about this course can be obtained at <<http://raven.ipfw.edu:8902>>, sign in as "guest" and also use "guest" as the password.

AUTHOR BIOGRAPHIES

Dr. Carlos Pomalaza-Ráez is chair and professor in the Department of Engineering at Indiana University-Purdue University Fort Wayne. He received a B.S.M.E. and a B.S.E.E. degree from Universidad Nacional de Ingeniería, Lima, Perú, in 1974, and the M.S. and Ph.D. degrees in electrical engineering from Purdue University, West Lafayette, IN, in 1977 and 1980, respectively. He has been a faculty at the University of Limerick, Ireland,

at Clarkson University, Potsdam, New York, and at the University of Oulu, Finland. He has also been a member of the technical staff at the Jet Propulsion Laboratory of the California Institute of Technology. His research interests are wireless communications networks, computer engineering, and signal processing.

Address: Department of Engineering, Indiana University—Purdue University Fort Wayne, 2101 E Coliseum Blvd., Fort Wayne, IN, 46805; telephone: 260-481-6353; fax: 260-481-5734; e-mail: raez@ipfw.edu.

Professor Groff is a faculty member of the Division of Organizational Leadership and Supervision at Indiana University-Purdue University Fort Wayne. She received a B.S. and M.Ed. degrees in

education from Bowling Green State University, Bowling Green, OH in 1985 and 1988, respectively. She has taught at the Computer Science Department at IPFW and also she served as Director of Student Services for the School of Engineering, Technology, and Computer Science where she co-developed and taught ETCS 101. Her research interests are instructional media design, interactive multimedia, human computer interface, and computer graphics. She is pursuing a M.S. degree in Computer Graphics Technology at Purdue University, West Lafayette.
